# 1. API/Mock Data

Pengujian data API dibuat dengan langsung membuat implementasi backend sederhana

<https://github.com/mfatihz/fsd15-fe-adv1-backend>

.env:  
PORT=5000

## 2. API Call

1. Fungsi pemanggilan API diletakkan pada folder services/api

2. Fetch data menggunakan axios

```
src > services > api > JS gallery-service.js > ...  
1  import axios from "axios";  
2  
3  export const getGalleries = (page) => {  
4    const API_URL = import.meta.env.VITE_API_URL;  
5    return axios.get(`${API_URL}/galleries/${page}`);  
6  }
```

3. .env:

VITE\_API\_URL=http://localhost:5000/api

## Implementasi tambahan

1. custom hooks
2. Store: Zustand
3. Fake auth login
